Title

APPARATUS AND METHOD FOR MANUFACTURING
A COMPOSITE GOLF CLUB HEAD

5

Technical Field

The present invention relates to a manufacturing method for a golf club head
10 composed of plies of pre-preg sheets. More specifically, the present invention relates to
a bladder-mold manufacturing method for a golf club head composed of plies of pre-
preg sheets.

Background Art

One of the first (if not the first) disclosures of a golf club head composed of a
15 plurality of plies of a pre-preg material is Great Britain Patent Application Number
1201648 which was filed in 1967 on behalf of William Charles Carlton.

In 1984, U.S. Patent Number 4,449,707 issued to Hayashi et al., for a Golf Club
Head Of Carbon Fiber Reinforced Plastic, based on a Japanese Patent Application
originally filed in 1982. The Hayashi Patent discloses surrounding a core with a fiber
20 reinforced fabric to create a golf club head with a proper center of gravity.

Another disclosure is U.S. Patent Number 4,545,580 to Tomita et al., for a
Wood-Type Golf Club Head, based on a Japanese Patent Application originally filed in
1983. The Tomita Patent discloses a durable golf club head having an outer shell
composed of a fiber reinforced plastic material, a foam center core, and an intermediate
25 shell formed of a thermoplastic resin material.

Yet another disclosure is U.S. Patent Number 4,630,826 to Nishigaki et al., for

Golf Club Head. The Nishigaki Patent discloses body composed of a carbon resin layer and a cast resin layer with a face insert block composed of a ceramic material.

Still another disclosure is U.S. Patent Number 4,778,185 to Kurokawa, for Wood-Type Core-Shell Golf Club Heads, based on a Japanese Patent Application
5 originally filed in 1984. The Kurokawa Patent discloses a golf club head composed of a foam core and a shell composed of a material fiber reinforced plastic having long and short fibers.

Yet another disclosure is U.S. Patent Number 4,793,616 to Fernandez, for Golf Club. The Fernandez Patent discloses a club head shell composed resin impregnated
10 fibers and ceramic particles within the resin to provide a high strength shell.

Yet another disclosure is U.S. Patent Number 5,154,425 to Niskanen et al., for a Composite Golf Club Head. The Niskanen Patent discloses a club head composed of a metal matrix composite of a ceramic matrix composite.

Although the prior art has disclosed many club head composed of composite
15 materials, the prior art has failed to provide a golf club head composed of a composite material that is lightweight, forgiving and has a high coefficient of restitution.

Summary of the Invention

20 The present invention provides a method and apparatus for manufacturing a golf club head that is composed of a composite material and is forgiving while providing better performance than other composite golf club heads.

Brief Description of the Drawings

FIG. 1 is an exploded view of a golf club head manufactured by the method of the present invention.

5 FIG. 2 is a front view of a golf club head manufactured by the method of the present invention.

FIG. 2A is a front view of a golf club head manufactured by the method of the present invention.

10 FIG. 3 is a top plan view of a golf club head manufactured by the method of the present invention.

FIG. 4 is a heel end view of a golf club head manufactured by the method of the present invention.

FIG. 5 is a toe end view of a golf club head manufactured by the method of the present invention.

15 FIG. 6 is a bottom plan view of a golf club head manufactured by the method of the present invention.

FIG. 7 is a cross-sectional view of the golf club head of FIG. 3 along line 7-7.

FIG. 8 is a cross-sectional view of the golf club head of FIG. 2 along line 8-8.

20 FIG. 9 is an isolated cross-section view of a face preform of the present invention.

FIG. 9A is an enlarged view of area A of FIG. 9.

FIG. 9B is an enlarged view of area B of FIG. 9.

FIG. 10 is an isolated cross-section view of a crown/face preform of a golf club head of the present invention.

FIG. 11 is an isolated cross-section view of a sole preform of the present invention.

5 FIG. 12 is a top plan view of a golf club head manufactured by the method of the present invention illustrating the variation in thickness of the walls of the golf club head.

FIG. 13 is a front plan view of a golf club head manufactured by the method of the present invention illustrating the variation in thickness of the walls of the golf club
10 head.

FIG. 14 is a bottom plan view of a golf club head manufactured by the method of the present invention illustrating the variation in thickness of the walls of the golf club head.

FIG. 15 is a heel end view of a golf club head manufactured by the method of
15 the present invention illustrating the variation in thickness of the walls of the golf club head.

FIG. 16 is a plan view of a face/crown ply having a ninety degree orientation.

FIG. 17 is a plan view of a full face ply having a ninety degree orientation.

FIG. 18 is a plan view of a face doubler ply having a ninety degree orientation.

20 FIG. 19 is a plan view of a sole ply having a negative forty-five degree orientation.

FIG. 20 is a flow chart of the general method of the present invention.

FIG. 21 is a flow chart of the face component creation step of the method of the present invention.

FIG. 22 is a flow chart of the compressing molding step of the method of the present invention.

5 FIG. 23 is a perspective view of the preform manufacturing apparatus.

FIG. 24 is a left side view of the preform apparatus.

FIG. 25 is a right side view of the preform apparatus.

FIG. 26 is a bottom plan view of the preform apparatus.

FIGS. 27a-b are schematic views of the plunger head for the face component.

10 FIGS. 28a-b are schematic views of the plunger head for the sole component.

FIGS. 29a-b are schematic views of the plunger head for the crown component.

Best Mode(s) For Carrying Out The Invention

15 As shown in FIGS. 1-6, a golf club head is generally designated 20. The club head 20 is either a fairway wood or a driver. The drivers range in loft angle of from six degrees to fifteen degrees. The club head 20 has a body 22 that is generally composed of a composite material such as plies of carbon pre-preg sheets, however, portions may be composed of metal or injected molded polymers. The body 22 has a crown 24, a
20 striking plate 26, a sole 28 with a bottom portion 28a and a ribbon 30. The ribbon preferably has an upper ribbon wall 30a and a lower ribbon wall 30b. The ribbon 30 generally extends from a toe end 32 to a heel end 34. The ribbon 30 generally begins at

one end of the striking plate 26 and ends at an opposite end of the striking plate 26. A rear 36 of the body 22 is opposite the striking plate 26 and is defined by portions of the ribbon 30, the crown 24 and the sole 28. Also, at the heel end 34 of the club head 20 is an internal tube 38 with an opening 39 for placement of a shaft therein. The internal
5 tube 38 is placed within the hollow interior 44 of the body 22. A weight member 40 is preferably located within the ribbon 30.

A sole plate 42 is disposed within a recess 29 of the bottom portion 28a of the sole 28. The sole plate 42 is preferably composed of a metal material such as aluminum or titanium, and preferably has a mass of 5 grams to 20 grams. A preferred mass for an
10 aluminum sole plate 42 is approximately 11 grams, and a preferred mass for a titanium sole plate 42 is approximately 18 grams. The sole plate 42 is preferably bonded within the recess 29 through the use of adhesives. The sole plate 42 preferably has embossed graphics thereon. The sole plate 42 increases the durability of the club head 20 since the sole 28 often impacts the ground during the striking of a golf ball.

15 The club head 20 also has a greater volume than a composite club head of the prior art while maintaining a weight that is substantially lower or equivalent to that of the prior art. The volume of the club head 20 ranges from 175 cubic centimeters to 450 cubic centimeters, more preferably ranges from 300 cubic centimeters to 400 cubic centimeters, and is most preferably 360 cubic centimeters for a driver. The mass of the
20 club head 20 ranges from 165 grams to 300 grams, preferably ranges from 175 grams to 225 grams, and most preferably from 188 grams to 195 grams. The body 22 of plies of pre-preg material has a mass ranging from 80 grams to 120 grams, and most preferably

98 grams.

The volume of the golf club head 20 is increased by increasing the vertical distance of the club head 20 from the sole 28 to the crown 24, as opposed to the horizontal distance of the heel end 34 to the toe end 32. This increase in volume is brought about by the dual wall structure of the ribbon 30. The upper ribbon wall 30a is approximately perpendicular relative to the crown 24, while the lower ribbon wall 30b preferably has an angle between 25 degrees and 75 degrees relative to the crown 24. The greater volume of the club head 20 allows the club head 20 to be more forgiving than prior art golf club heads while providing better performance. The mass of club head 20 is much lower than metal club heads of similar volumes, and thus the large volume does not deter from the swing of a golfer.

The striking plate 26 has a smaller aspect ratio than striking plates of the prior art. The aspect ratio as used herein is defined as the width, "w", of the striking plate divided by the height, "h", of the striking plate 26, as shown in FIG. 2A. In one embodiment, the width w is 90 millimeters and the height h is 54 millimeters giving an aspect ratio of 1.666. In conventional golf club heads, the aspect ratio is usually much greater than 1. For example, the original GREAT BIG BERTHA® driver had an aspect ratio of 1.9. The aspect ratio of the present invention preferably ranges from 1.0 to 1.7.

As shown in FIG. 7, the internal tube 38 lies within the hollow interior 44 of the club head 20. The internal tube is preferably composed of a metal material and has a mass ranging from 8 grams to 20 grams. The internal tube 38 is most preferably composed of stainless steel and has a mass of approximately 14 grams. The internal

tubing 38 has a bore 130 to receive an insert and a shaft, not shown, therein.

Preferably, the club head 20 has a hollow interior 44 defined by the body 22, however, the light weight of the composite body 22 allows for numerous manipulations in placement of weight, foam, sound enhancing devices and the like within the hollow interior 44.

Referring specifically to FIG. 1, the club head 20 has a weight member 40 disposed within the plies of pre-preg that compose the ribbon 30 of the club head 20. Preferably, the weight member 40 is composed of three weight members 40a, 40b and 40c. The weight member 40 is preferably composed of a polymer material integrated with a metal material. The metal material is preferably selected from copper, tungsten, steel, aluminum, tin, silver, gold, platinum, or the like. A preferred metal is tungsten. The weight member 40 has a density greater than the composite material of the body 22. Preferably, the weight member 40 extends from approximately the heel end 34 of the striking plate 26 through the rear 36 to the toe end 32 of the striking plate 26. However, the weight member 40 may only extend along the rear 36 of the ribbon 30, the heel end 34 of the ribbon 30, the toe end 32 of the ribbon 30, or any combination thereof.

The placement of the weighting members 40a-c allows for the moment of inertia of the golf club head 20 to be optimized. In one preferred example of the golf club head 20 of the present invention, the moment of inertia about the Ixx axis through the center of gravity is approximately 2566 grams-centimeters squared ("g-cm²"), the moment of inertia about the Iyy axis through the center of gravity is approximately

1895 g-cm², and the moment of inertia about the Izz axis through the center of gravity is approximately 3368 g-cm².

As shown in FIGS. 8, 9, 9A and 9B, a return portion 100 is a transition area from a perimeter 29 of the striking plate 26 rearward towards the crown 24. The return portion 100 has a thickness ranging from 0.100 inch to 0.200 inch to control the compliance of the striking plate 26. The return portion 100 has an upper section 100a, a lower section 100b, a heel section 100c, not shown, and a toe section 100d, not shown. The return portion 100 also has a taper region 101, which includes an upper tapering region 101a, a lower tapering region 101b, a heel tapering region 101c, not shown, and a toe tapering region 101d, not shown. The tapering region 101 tapers in thickness from a greater thickness nearer the striking plate portion 26 to a lesser thickness rearward toward the crown 24.

The return portion 100 has a predetermined length which extends rearward from the perimeter 29 of the striking plate portion 26 into the crown 24. Preferably, the distance of the return portion 100, "Dr", ranges from 0.25 inch to 2.0 inches, more preferably from 0.5 inch to 1.75 inches, and most preferably 1.5 inches. Preferably, the distance from the perimeter 29 to the beginning of the tapering region 101 of the return portion 100 ranges from 0.25 inch to 1.5 inches, and most preferably 1.0 inch.

The body 22 is manufactured from a face component 125, which includes the striking plate portion 26 and the return portion 100, a crown component 124 and a sole component 128. The crown component 124 overlaps the face component 125, as shown in FIG. 10. The sole component 128 includes the ribbon portion 30 and the

bottom portion 28a. The sole component 128 is attached to the crown component 124 and the face component 125.

FIGS. 16-19 illustrate preferred pre-preg sheets for forming the composite body of the golf club head 20. FIG. 16 illustrates a face/crown ply pre-preg sheet that is generally designated 55. The face/crown ply 55 has a plurality of fibers 51 dispersed within a resin body 53. The fibers 51 are preferably composed of a carbon material. Alternatively, the fibers 51 may be aramid fibers, glass fibers or the like. The resin is typically an epoxy material. The relation of the fibers 51 to the striking plate 26, when the striking plate 26 is in a position to strike a golf ball, determines the orientation of the fibers 51. If the fibers 51 are parallel with the ground, or in other words extending across from the toe end to the heel end, then the face/crown ply 55 has a zero degree orientation. If the fibers 51 are approximately perpendicular to the ground, as shown in FIG. 16, or in other words extending from the crown to the sole, then the face/crown ply 55 has a ninety degrees orientation.

FIG. 17 illustrates a full face ply pre-preg sheet that is generally designated 57. As with the face/crown ply 55, the full face ply 57 has a plurality of fibers 51 dispersed within a resin body 53. The fibers 51 extend from the sole 28 to the crown 24, and thus the full face ply 57 has fibers 51 that are perpendicular to the ground when it is in a position for striking a golf ball. Therefore, the full face ply 57 of FIG. 17 has a ninety degrees orientation.

FIG. 18 illustrates a face doubler ply pre-preg sheet that is generally designated 58. As with the face/crown ply 55, the face doubler ply 58 has a plurality of fibers 51

dispersed within a resin body 53. The fibers 51 extend from the sole 28 to the crown 24, and thus the face doubler ply 58 has fibers 51 that are perpendicular to the ground when it is in a position for striking a golf ball. Therefore, the face doubler ply 58 of FIG. 18 has a ninety degrees orientation.

5 FIG. 19 illustrates a sole ply pre-preg sheet that is generally designated 59. As with the face/crown ply 55, the sole ply 59 has a plurality of fibers 51 dispersed within a resin body 53. The fibers 51 extend at a forty-five degree angle relative to the ground when it is in a position for striking a golf ball. Therefore, the sole ply 59 of FIG. 19 has a forty-five degree orientation.

10 As previously stated, the preferred composite material is plies of carbon pre-peg sheets. Plies of pre-preg composite sheets are manufactured by pulling strands of fiber in a parallel motion, preferably carbon, aramid or glass fiber, through a resin film and allowing the resin to partially cure or "stage". When the resin is partially staged, the resin holds the fibers together such that the fibers form a malleable sheet with all of the
15 fibers in a specific orientation relative to an edge of the sheet. Preferred orientations are zero degrees, plus forty-five degrees, minus forty-five degrees and ninety degrees.

 The manipulation of the thickness of the various regions of the body 22 allows the golf club head 20 to have superior durability, forgiveness and performance as compared to prior art composite golf club heads. As shown in FIGS. 12-15, the
20 thickness of the body 22 is focused on the striking plate portion 26. In a most preferred example: the region designated A of the striking plate portion 26 has a thickness of approximately 0.169 inch; the region designated B, at the junction of the crown 24 and

striking plate 26 has a thickness of approximately 0.188 inch; the region designated C of the bottom portion 28a of the sole 28 has a thickness of approximately 0.221 inch; the region designated D of the ribbon 30 and of the bottom portion 28a has a thickness of approximately 0.202 inch; the region designated E of the crown 24, the bottom
5 portion 28a and the ribbon 30 has a thickness of approximately 0.033 inch; and the region designated F of the crown 24 has a thickness of approximately 0.191 inch. The regions designated Z1, Z2, Z3, Z4, Z5 and Z6 are tapering zones where the thickness tapers rearward.

The golf club head 20 is preferably manufactured using a bladder molding
10 process. FIG. 20 illustrates the general method of the present invention. At block 200, the face component 125 or face cup preform is created by laying up a plurality of plies of pre-preg sheets. The plies of pre-preg sheets create the striking plate 26 and the return portion 100 of the face component 125. A detailed example of the face component 125 is set forth below. At block 202, the crown component 124 or crown
15 preform is created by laying up a plurality of plies of pre-preg sheets over the face component 125 as shown in FIG. 10. The plies of pre-preg sheets create the crown 24, the striking plate 26 and the return portion 100. A detailed example of the crown component 124 is set forth below. At block 204, the sole component 128 or sole preform is created by laying up a plurality of plies of pre-preg sheets with a plurality of
20 weight members 40a-c. The plies of pre-preg sheets are folded over the plurality of weight members 40a-c. The plies of pre-preg sheets create the ribbon 30 and the bottom portion 28a. A detailed example of the sole component 128 is set forth below.

At block 206, the face cup component 125, crown component 124 and sole component 128 are assembled to form an assembled unit. An inflatable bladder, preferably made from latex, silicone, or similar materials, is placed within the interior of the assembled unit during assembly and an access end of the bladder is placed

5 through the bladder port. At block 208, the assembled unit is placed within a compaction device and pre-compacted to form a pre-compacted unit. At block 210, the pre-compacted unit is placed within a compression mold for bladder molding of the pre-compacted unit into a molded unfinished golf club head. At block 212, the molded golf club head is finished to create the golf club head 20.

10 During the bladder molding, a source of pressurized gas (not shown) is attached by a gas line to the bladder, and the bladder is inflated within the hollow interior of the pre-compacted unit. The bladder engages the inside surface of the pre-compacted unit, forcing the plies of pre-preg sheets against the inner wall of the compression mold. The mold is then heated at a predetermined temperature for a selected period of time, i.e., a

15 time sufficient to allow proper curing of the resin within the pre-preg sheets. After depressurizing, the bladder is removed through the bladder port 43, and the molded unfinished golf club head is removed from the compression mold. Those skilled in the art will appreciate that, depending upon the type of resin used, curing temperatures may range from 250° to 800° F, the requisite curing time may range from a few minutes (for

20 example, in the case of a "quick cure" epoxy or a thermoplastic resin) to 1.5 hours, and the pressure applied via the latex or silicone bladder may range from 100 to 300 psi.

FIG. 21 illustrates the face component creation process of block 200 of FIG. 20.

At block 300, a first predetermined quantity of plies of pre-preg sheets for the face component 125 are placed within a cavity configured to approximate the face component 125. At block 302, this first predetermined quantity of plies of pre-preg sheets for the face component 125 are compressed by using a plunger or other similar device to create a stack of compressed plies. At block 304, a second predetermined quantity of plies of pre-preg sheets for the face component 125 are placed within the cavity over the compressed plies. At block 306, this second predetermined quantity of plies of pre-preg sheets for the face component 125 are compressed by using a plunger or other similar device to create a stack of more compressed plies. At block 308, the process is repeated until a desired thickness of the face component 125 is achieved by the process.

This process may be repeated to form both the crown component and the sole component. It would be necessary prior to repeating the steps to exchange the mold cavities so that the appropriate mold cavity is configured to approximate the crown component 124 in forming the crown preform, or to approximate the sole component 128 in forming the sole preform.

FIG. 22 is a flow chart of the assembly and pre-compaction steps. At block 400, the face-component/crown component is created by laying up the plies of the crown component over the face component 125. At block 402, the inflatable bladder is placed within the sole component 128 and extended through the bladder port 43. At block 404, the assembled unit is placed within a compaction mold, and an extension of the bladder is extended through a bore in the mold. At block 406, the compaction mold is

sealed and the assembled unit is compacted to form the pre-compaction unit.

In a preferred embodiment, the face component 125 is composed of forty-eight plies of pre preg sheets: forty full face plies 57 in orientations of zero degrees, plus forty-five degrees, minus forty-five degrees and ninety degrees; and eight face doubler plies 58 in zero degrees and ninety degrees orientations. The crown component 124, which is applied over the face component 125, is composed of seven face/crown plies 55 in orientations of zero degrees, plus forty-five degrees, minus forty-five degrees and ninety degrees. The sole component 128 is composed of seven sole plies 59 in orientations of zero degrees, plus forty-five degrees, minus forty-five degrees and ninety degrees. The second and third pairs of sole plies 59 are folded over the plurality of weight members 40a-c. In a preferred embodiment, the outer plies are a twill pattern for aesthetic purposes and some durability support.

FIGS. 23-26 illustrate an apparatus 130 used in forming the preforms for a golf club head. The apparatus 130 comprises a mold 132 having an opening 133 in the top portion to define a cavity 134. The mold 132 is mounted to the apparatus 130 by a mold support plate 136. The mold support plate 136 is attached to the mold 132 at a top location and to a mold base plate 138 at a bottom location. The mold base plate 138 is held in place by attachment to a base 140 of the apparatus 130. The base 140 of the apparatus 130 may be free standing or may be mounted to a support structure using tabs 141 or other means of attachment.

The mold cavity 134 may be configured to approximate a face cup component 125, crown component 124 or sole component 128 by having an interior surface that

conforms to the shape and volume of the component to be molded. A plunger head 142 is mounted on a removable plunger plate 144. The plunger head 142 is comprised of silicone, urethane or other elastomeric materials and preferably has a durometer ranging from 25 to 85 shore A and an elongation range of 100 % to 700 %. The plunger head
5 142 and removable plunger plate 144 is located above the cavity 134 and is used to compress the plies of pre-preg sheets into the cavity 134. The plunger head 142 may be of various sizes to approximate the size of the cavity 134 and is designed so that as the size of the plunger head 142 decreases, the corresponding volume of the preform that is created by using the plunger head 142 decreases. The removable plunger plate 144
10 allows for an assortment of plunger heads 142 to be interchanged to approximate the particular cavity size chosen for manufacturing a preform of the face cup component 125, crown component 124 or sole component 128.

Once the particular preform to be manufactured is chosen, the plunger head 142 is activated to press the plies into the cavity to form the preform. Preferable pressure
15 ranges for the plunger head 142 may range from 30-80 psi, however these ranges may be increased or decreased depending upon variations in the materials chosen to fabricate the preforms. The removable plunger plate 144 with attached plunger head 142 is mounted to a fixed plate 146. The fixed plate 146 is subsequently attached via an attachment piece 148 to a moveable rod 150 located in a bottom portion of a lower
20 support plate 152. The lower support plate 152 is used to support a pneumatic cylinder 154. Thus aligning the pneumatic cylinder 154, plunger head 142, and cavity 134 along a longitudinal axis. The pneumatic cylinder 154 travels up and down in a vertical

direction to allow oscillation of the plunger head 142 in and out of the cavity 134 along this longitudinal axis. A release lever 156 is located on the mold support plate 136 and is used to raise the plunger head 142 once the pre-preg plies have been compressed in the cavity 134. The pneumatic cylinder 154 is held in place by a series of support rods

5 158a-d in conjunction with the lower support plate 152 and an upper support plate 160.

A mounting plate 162 is attached to a rear portion of the upper support plate 160 at one end and to the lower support plate 152 at an opposite end. A support arm 164 is used to align the mounting plate 162 in a vertical direction and is attached at one end to the mounting plate 162 and at an opposite end to the apparatus base 140.

10 FIGS. 27a-b, 28a-b, and 29a-b are schematic views of the plunger head 142 apparatus with respect to the face, sole and crown components, respectively. As can be seen from the schematic drawings, the volume of the plunger head increases and decreases with respect to the particular component to be manufactured. Preferable volume ranges for a plunger head used in manufacturing a preform for a small face

15 component may range from 10in^3 to 18in^3 , with a more preferable volume of 14.4in^3 . Alternatively, for a large face preform the preferable volume range for the plunger head may be from 14.00in^3 to 18.00in^3 , with a more preferable volume of 16in^3 . For a plunger head used in manufacturing a preform for the sole component a preferable volume range would be 25in^3 to 32in^3 , with a more preferable volume of 30.4in^3 .

20 Whereas for a plunger head used in manufacturing a preform for the crown component a preferable volume range would be 38in^3 to 45in^3 , with a more preferable volume of 41in^3 .

CLAIMS

1. An apparatus for producing preforms for a golf club head, the preforms composed of plies of pre-preg sheets, the apparatus comprising:
 - 5 a mold defining a cavity, the mold having a top surface with an opening therein to the cavity;
 - a plunger head configured to compress plies of pre-preg sheets placed within the cavity; and
 - a pneumatic cylinder, the plunger head attached to the pneumatic cylinder at one
 - 10 end, the pneumatic cylinder, plunger head and the mold aligned along a longitudinal axis, the pneumatic cylinder allowing for oscillation of the plunger head along the longitudinal axis.
2. The apparatus according to claim 1 wherein the mold defines a cavity
- 15 configured for a face component for a composite golf club head, and the plunger head is configured to compress plies of pre-preg sheets into the shape of the face component, the face component having a striking plate portion and a return portion.
3. The apparatus according to claim 1 wherein the mold defines a cavity
- 20 configured for a crown component for a composite golf club head, and the plunger head is configured to compress plies of pre-preg sheets into the shape of the crown component.

4. The apparatus according to claim 1 wherein the mold defines a cavity configured for a sole component for a composite golf club head, and the plunger head is configured to compress plies of pre-preg sheets into the shape of the sole component.

- 5 5. A method for forming preforms for a golf club head, the preforms composed of plies of pre-preg sheets, the method comprising:

placing a plurality of plies of pre-preg sheets in a mold cavity, the mold cavity configured to define a preform for a component of a golf club head;

- lowering a plunger head along a longitudinal axis toward the mold cavity, the
10 plunger head configured to compress the plurality of plies of pre-preg sheets into a component of a golf club head;

compressing the plurality of plies of pre-preg sheets with the plunger head to form a component of a golf club head; and

removing the component of a golf club head from the mold cavity.

15

6. A method for forming a sole component for a golf club head, the sole component composed of plies of pre-preg sheets, the method comprising:
- placing a plurality of plies of pre-preg sheets in a mold cavity, the mold cavity configured to define a sole component for a golf club head;
- 5 lowering a plunger head along a longitudinal axis toward the mold cavity, the plunger head configured to compress the plurality of plies of pre-preg sheets into a sole component for a golf club head;
- compressing the plurality of plies of pre-preg sheets with the plunger head to form a sole component for a golf club head; and
- 10 removing the sole component for a golf club head from the mold cavity.
7. A method for forming a crown component for a golf club head, the crown component composed of plies of pre-preg sheets, the method comprising:
- placing a plurality of plies of pre-preg sheets in a mold cavity, the mold cavity
- 15 configured to define a crown component for a golf club head;
- lowering a plunger head along a longitudinal axis toward the mold cavity, the plunger head configured to compress the plurality of plies of pre-preg sheets into a crown component for a golf club head;
- compressing the plurality of plies of pre-preg sheets with the plunger head to
- 20 form a crown component for a golf club head; and
- removing the crown component for a golf club head from the mold cavity.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US03/02825

A. CLASSIFICATION OF SUBJECT MATTER

IPC(7) : B29C 53/04

US CL : 264/257, 258, 320,325; 425/412,383

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 264/257, 258, 320,325; 425/412,383

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)
EAST**C. DOCUMENTS CONSIDERED TO BE RELEVANT**

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
Y	US 5,410,798 A (LO) 02 May 1995 (02.05.1995), see entire document.	1-7
Y	US 5,377,986 A (VIOLLAZ et al) 03 January 1995 (03.01.1995), see entire document.	6,7

☐ Further documents are listed in the continuation of Box C.☐ See patent family annex.

* Special categories of cited documents:	"T"
"A" document defining the general state of the art which is not considered to be of particular relevance	later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
"B" earlier application or patent published on or after the international filing date	"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
"O" document referring to an oral disclosure, use, exhibition or other means	"&" document member of the same patent family
"P" document published prior to the international filing date but later than the priority date claimed	

Date of the actual completion of the international search

19 March 2003 (19.03.2003)

Date of mailing of the international search report
